

We are one of the 6 main classes of vertebrate animals.

We are warm blooded.

We are one of the smaller classes with only 4,000 different species.

Mammals

There are 41,000 different species.

They are cold-blooded, which means their body changes with the temperature around them.

They live and breathe in the water.

Fish

There are 800,000 different species.

We have an exoskeleton and my body is split into three parts known as the head, thorax, and the abdomen.

Some of us are poisonous, but
many of us are not.

Insects

Most of us live on land, but we
have to return to the water in
order to breed.

We are vertebrates and
cold-blooded.

Most of us eat insects.

Amphibians

We live in your backyard in the
Spring and Summer.

We live in trees and nest.

We don't like the cold so we fly
south.

Birds

Some of us evolved from
amphibians.

We are cold-blooded and have
scales.

Most of us live in tropical
places.
